

Solar Energy Research
Institute of Singapore

SERIS Safety and Health Policy

The higher-level goal of SERIS is to enable the realization of a sustainable energy supply through its research and development in the area of solar technologies. The institute has established and will continue to maintain and improve a Safety and Health Management System, covering core integrated services. The goal of the safety and health policy is to provide a positive safety and health environment as well as to continually improve the system.

SERIS has adopted a Safety and Health Management System. The focus areas are as follows:

- Adherence to local legal and other requirements
- Pollution prevention, especially for chemical and waste handling activities
- Protecting employees and interested parties from workplace incidents
- Preventing ill-health from employees dealing with hazardous materials and substances
- Encouraging employees to report near-misses

The Safety and Health Management System is structured in a manner which is understandable by all employees. The System is flexible enough to cover all activities identified within its scope. The System further allows SERIS to adapt to customers' requirements and needs, as well as compliance to changing legal requirements.
